

AMENDED CLAIMS

1. (Currently Amended): A flexible web barrier having generally parallel edges, having substantially greater length than width, and capable of being rolled longitudinally, wherein:
 - (a) the web is cut longitudinally to form slits at intervals, the slits defining linear members comprising at least a top strand and a bottom strand and a plurality of cross members; and,
 - (b) displacing the bottom strand ~~is able to be displaced in relation~~ longitudinally relative to the top strand deploys the cross members so as to increase the width of the barrier, leaving regular voids.
2. (Original): The barrier of claim 1 wherein the slits are continuous.
3. (Original): The barrier of claim 1 wherein the slits are series of perforations.
4. (Original): The barrier of claim 3 wherein the perforations are irregular.
5. (Original): The barrier of claim 1 also comprising a coating.
6. (Original): The barrier of claim 5 wherein the coating is continuous.
7. (Original): The barrier of claim 5 wherein the coating is intermittent.
8. (Original): The barrier of claim 1 also comprising a readily detectable substance.
9. (Original): The barrier of claim 5 also comprising a readily detectable substance.
10. (Original): The barrier of claim 8 wherein the detectable substance is metallic.
11. (Original): The barrier of claim 9 wherein the detectable substance is metallic.
12. (Original): The barrier of claim 1 wherein the web is electrically conductive.
13. (Original): The barrier of claim 5 wherein the coating is electrically conductive.
14. (Original): The barrier of claim 1 also comprising integral flags.
15. (Original): The barrier of claim 1 configured to separate into at least two tapes comprising integral flags.
